SUMMARY

Senior Software Engineer with **4 years of experience building casual mobile games**. Currently lead a lean engineering team on a **live-ops F2P casual game with 10M+ downloads, 700K+ DAU and over \$20M in annual revenue**. Focused on full-stack development of the game across the **Unity/C# client and Golang backend**.

WORK EXPERIENCE

Senior Software Engineer

August 2025 – Present

PlaySimple Games (Google Launchpad startup, acquired for \$360M)

Bangalore, India

- **Tech Lead** for a live-ops casual game with **10M+ downloads, 700K+ DAU and \$20M+ annual revenue**, leading a lean team of four engineers across code architecture and sprint execution. Store: [Android](#), [iOS](#)
- Designed a **real-time leaderboard serving 700K+ daily players** (Golang, Redis), sharded by player-engagement tier with entries updated on periodic saves, **boosting engagement by 10%**.
- Owned **production stability** at **~99% crash-free sessions and ~1% ANR** through profiling-led code and memory optimisation, and kept the product current through **engine and SDK upgrades, Google Play compliance and data-privacy compliance (GDPR, CCPA, DPDP)**.
- Developed an **AI-assisted engineering workflow** that **saved 20% of engineering bandwidth**, built on coding harnesses (**Claude Code, Cursor**) with custom plugins, skills and MCPs, covering requirements → design doc → implementation → tests.
- Built an **AI-driven CI/CD failure-analysis system** that finds the root cause of failed **Jenkins** pipelines and posts the cause and fix to Slack, eliminating manual log triage.
- Led **design and code reviews**, mentored new engineers to independent feature and release ownership, and ran **interviews and assignment reviews** for hiring.
- Collaborated with **product, production, design and QA** on **technical feasibility of features, roadmap planning and resource allocation**, and built **in-house tools** for designers and QA.

Software Engineer

August 2023 – July 2025

PlaySimple Games

Bangalore, India

- Led **end-to-end development and global launch of [Tile Mahjong](#)**, a match-three SKU built on the existing Tilematch codebase: built the **Unity/C# and Android (Java) client**, extended the **Golang game server** and its **ScyllaDB and Redis** data layer, and integrated analytics, Crashlytics, ads and IAP SDKs.
- Migrated design-data configs from JSON to **Protocol Buffers**, cutting content and download size and reducing GC overhead during serialization.
- Built **Jenkins CI/CD pipelines** to ship builds across platforms, streamline DLC and remote-content delivery, and deploy game servers.
- Shipped features end-to-end using **SOLID principles and design patterns**, driving engagement, retention, live-ops and monetization: leaderboards, Quest Center, economy and reward systems, Long-Term Progression Meta, Events Infrastructure, PowerUps, Player Profile, a designer-configurable Tutorial System and IAP flows.

Associate Software Engineer

August 2022 – July 2023

PlaySimple Games

Bangalore, India

- Designed and built the **core gameplay of a match-three game** using a **graph-based tile model** instead of physics, and **prototyped and shipped the MVP in 2 months**, the fastest MVP launch in company history.

- Built a **modular Localization package** reused across multiple games, supporting **15+ languages** and contributing to **3x user-acquisition growth**.
- Cut **app launch time by 12% (p50 by 200ms, p99 by 2s)** by profiling the launch path and introducing **lazy loading** of non-critical dependencies and features.
- Built **in-Unity tools for game designers and QA**: UI/UX design tools, QA utilities and editor scripts that streamlined design and test workflows.

Software Engineer Intern

PlaySimple Games

August 2021 – July 2022

Bangalore, India

- Built the **Android notification infrastructure** from scratch for a live card game, driving re-engagement and improving later-cohort retention.
- Shipped **gameplay features, minigames and internal tools** for **Destination Solitaire**, a live TriPeaks card game, owning each from spec through architecture to deployment.

SKILLS

Languages: C#, Golang, Java, C++, Python

Game Client: Unity, Unity UI, Unity Profiler, Memory Profiler, Frame Debugger, Android (Java), iOS

Backend: Golang, REST, gRPC, Microservices, Event-Driven Architecture, Distributed Systems

Data: ScyllaDB, Redis, SQL

Infra & Tooling: Jenkins CI/CD, DigitalOcean, Git, Firebase, Datadog, Embrace

AI Tooling: Agentic coding workflows, agent harnesses (Claude Code, Cursor), custom plugins & skills, MCP servers, LLM integration

Problem Solving: Leetcode (Top 8%), Codeforces (Expert, Top 20%), Google Kickstart (Top 10%)

EDUCATION

KIET Group Of Institutions, AKTU

Bachelor of Technology in Information Technology

2018-2022

CGPA: 8.33/10
