SUMMARY

Senior Software Engineer with **4 years of experience building casual mobile games**. Currently lead a lean engineering team on a **live-ops F2P casual game with 1M+ DAU generating over \$20M in annual revenue**. Focused on full-stack development of the game across the **Unity/C# client and Golang backend**.

WORK EXPERIENCE

Senior Software Engineer

August 2025 – Present

PlaySimple Games (Google Launchpad startup, acquired for \$360M)

Bangalore, India

- **Tech Lead** for a live-ops casual game with **1M+ DAU and \$60K+ daily revenue (\$20M+ annually)**, leading a lean team of four engineers across code architecture and sprint execution. Store: [Android](#), [iOS](#)
- Led **feature design review meetings**, conducted **in-depth code reviews**, drove **unit-test coverage**, and **mentored and ramped up fellow engineers**.
- Collaborated with input functions to provide **technical insights on features**, worked with production on **roadmap planning and engineering resource allocation**, and partnered with game designers and QA to build **in-house tools**.
- Designed a **real-time leaderboard serving 1M+ daily players** (Golang, Redis, C#), sharded by player-engagement tier with entries updated on periodic player saves, **boosting engagement by 10%**.
- Cut content and download size and reduced GC overhead by moving game data off JSON: integrated **Protocol Buffers** for design data and migrated reward configs to **MessagePack**.
- Designed the **multi-platform release process** to ship **Android, iOS and pre-installed OEM builds** in a single release train, and drove **Unity 6, SDK and Addressables upgrades** plus Google Play 16KB page-size compliance.
- Owned **production stability** at **~99% crash-free sessions and ~1% ANR**, through code and memory optimisation guided by **Unity Profiler, Memory Profiler, Frame Debugger** and Android Profiler, with monitoring on Firebase, Datadog and Embrace.
- Reduced **feature shipping time by 20%** with an **AI-assisted workflow built on agent harnesses** (Claude Code) with custom plugins, skills and MCPs, covering requirements → design doc → implementation → tests → self-review.
- Built an **AI-driven CI/CD failure-analysis system** that finds the root cause of failed Jenkins pipelines and posts the cause and fix to Slack, eliminating manual triage.

Software Engineer

August 2023 – July 2025

PlaySimple Games

Bangalore, India

- Led **end-to-end development and global launch of [Tile Mahjong](#)**, a match-three SKU built on the existing Tilematch codebase: built the **Unity/C# and Android (Java) client**, extended the existing **Golang game server** and its **ScyllaDB and Redis** data layer for the new title, and integrated analytics, Crashlytics, ads and IAP SDKs.
- Shipped features end-to-end, from requirements to release, using **SOLID principles and software design patterns**:
 - **Engagement**: Quest Center, PowerUps, Personalised Puzzle Difficulty
 - **Retention**: Long-Term Progression Meta, Player Profile System, designer-configurable Tutorial System
 - **Live-ops**: Events Infrastructure powering recurring in-game events
 - **Monetization**: IAP features

- Built and configured **Jenkins CI/CD pipelines** for Android/iOS builds, remote content delivery, SDK integrations and the release process.
- Implemented **GDPR, CCPA and DPDP data-compliance** requirements across the product.

Associate Software Engineer

August 2022 – July 2023

PlaySimple Games

Bangalore, India

- Designed and built the **core gameplay of a match-three game** using a **graph-based tile model** instead of physics, and **prototyped and shipped the MVP in 2 months**, the fastest MVP launch in company history.
- Built a **modular Localization package** reused across multiple games, supporting **15+ languages** and contributing to **3x user-acquisition growth**.
- Cut **p50 launch time by 200ms** and **p99 by 2s** by optimising critical launch-path API calls and lazy-loading non-essential content.
- Built **in-Unity tools for game designers and QA**: UI/UX design tools, QA utilities and editor scripts that streamlined design and test workflows.

Software Engineer Intern

August 2021 – July 2022

PlaySimple Games

Bangalore, India

- Built the **Android notification infrastructure** from scratch for a live card game, driving re-engagement and improving later-cohort retention.
- Shipped **gameplay features, minigames and internal tools** for **Destination Solitaire**, a live TriPeaks card game, owning each from spec through architecture to deployment.

SKILLS

Languages: C#, Golang, Java, C++, Python

Game Client: Unity, Unity UI, Unity Profiler, Memory Profiler, Frame Debugger, Android (Java), iOS

Backend: Golang, REST, gRPC, Microservices, Event-Driven Architecture, Distributed Systems

Data: ScyllaDB, Redis, SQL

Infra & Tooling: Jenkins CI/CD, DigitalOcean, Git, Firebase, Datadog, Embrace

AI Tooling: Agentic coding workflows, agent harnesses (Claude Code, Cursor), custom plugins & skills, MCP servers, LLM integration

Problem Solving: Leetcode (Top 8%), Codeforces (Expert, Top 20%), Google Kickstart (Top 10%)

EDUCATION

KIET Group Of Institutions, AKTU

2018-2022

Bachelor of Technology in Information Technology

CGPA: 8.33/10
